Question 1: How secure coding related to XSS?

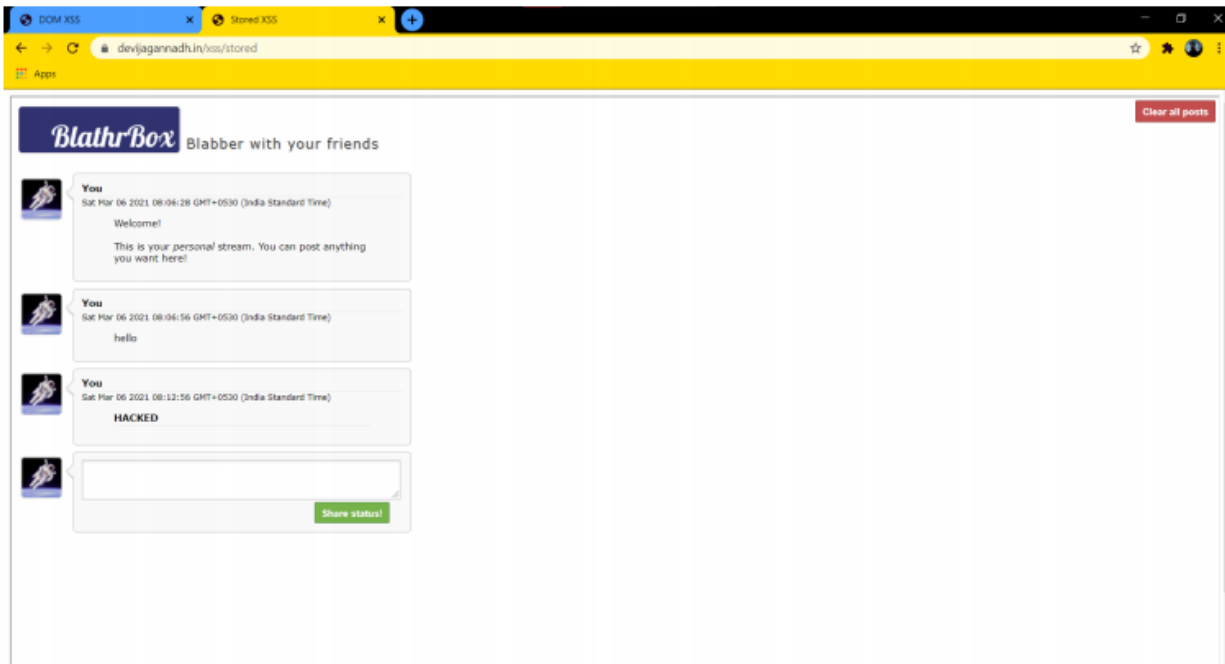

- **XSS** occurs when untrusted input (often data) is rendered as output on a page but misinterpreted as executable **code**. An attacker can place malicious executable **code** (HTML tags, JavaScript, etc.) within an input parameter, which -- when returned back to the browser -- is then executed instead of displayed as data.

Task

Rxss on demo website

TASK: Stored xss on demo website

Task:DOM xss on demo website
